

CYBERCRIME AWARENESS CASE STUDY & PREVENTION GUIDE

Choose one of the following cybercrime types: Phishing, UPI/Online Payment Fraud, Identity Theft, Cyberbullying, or Ransomware

UPI fraud is becoming very common nowadays in India. It is a type of cybercrime where people are tricked into sending money online without realising it. Many times, the fraud starts with a phone call or message from someone who pretends to be from bank or some service. They may say that your refund is pending or your account will be blocked if you dont act fast.

After that, they ask the person to click a link or scan a QR code. Some people think they are receiving money, but actually they are sending it. In some cases, the fraudster asks for OTP or UPI pin by saying it is needed for verification, which is not true. Once the victim shares these details or approves the request, money gets deducted from their account instantly.

Usually students, old people or those who are not very famillier with online payments become easy targets. The main consequence is loss of money, but it also creates stress and fear in the person. Sometimes personal data can also be misused.

To avoid such frauds, people should never share OTP or UPI pin with anyone. Also they should not trust unknown calls or messages. Awareness is very important to stay safe in digital world.
